

# BETTER UNDERSTAND YOUR PATIENTS & THEIR PAIN

## Why Priska?

Priska™ provides an easy-to-use, cloud-based solution to address the emerging legal framework in and around pain management.

### About The Priska Solution

**The Opioid Risk Tool assessment** consists of a 5-question survey, taking less than five minutes for a patient to complete and fits each patient into one of three risk categories: low risk, moderate risk or high risk. The peer-reviewed tool is highly trusted and widely used. Priska brings the peer-reviewed and nationally-recognized work of Dr. Lynn Webster into the easily accessible SaaS-based solution. Webster LR. Predicting aberrant behaviors in opioid-treated patients: Preliminary validation of the opioid risk tool. Pain Medicine. 20005;6(6):432-442. Used With Permission.

**The Priska Behavioral Assessment of Pain (BAP-2)** was developed and standardized for use in the clinical assessment of adults with sub-acute and chronic pain. This 223-question assessment provides physicians with a more comprehensive view of a patient's psychosocial risk factors.

**The Priska Medical Stability Quick Screen** gives doctors a brief overview of their mental well-being. It can be used to help identify problem areas that need further review. The goal of the Priska Medical Stability Quick Screen is to allow people with persistent pain to feel heard and validated. A bar graph skyline profile of their results is quickly generated for physicians to gain additional insights into their wellbeing in seconds.

#### DISCLAIMER

Screening is used to identify the likelihood a patient is at risk of having a specific health condition. However, it does not provide a diagnosis and should not be used in lieu of or absent counsel from a medical professional. Priska™ does not function to deliver a complete and full diagnosis of a patient's mental health or any other condition. Priska is designed to be one part of an overall practitioner's assessment toolkit, and requires review and consideration by an accredited practitioner. Priska does not and cannot guarantee, warrant, or certify that use of the Priska platform and assessments accurately indicate a patient's risk or mental condition, or the veracity of a patient's responses. Priska™ Tools should be used as an ancillary item to help further inform practitioners who write pain management protocols. Doctors should however use every tool available to them, such as abuse-deterrent opioids, lock boxes, safer packaging, government-run prescription monitoring programs that identify people accessing multiple prescribers, and state-of-the-art drug tests.
